

Original IG entity reference verification

Verify whether the entity marked by a yellow dot in an original Instagram image matches the single reference photo chosen by the original annotator.

This task audits legacy `ig_entity_tagging_submissions` data, which used point annotations rather than bounding boxes.

How to verify

What you'll see

Each item has two images:

- **Target image (left):** the original Instagram image. A **yellow dot** marks the location the original annotator selected.
- **Reference photo (right):** one reference image selected by the original annotator for that entity. If a crop exists, it may be outlined in green.

The task header shows the entity type (person, clothing, product, location, landmark, animal, information, or style) and a label such as *Clothing 2* or *Person 1*.

Workflow

1. Read the **entity type** and label.
2. On the target image, locate the object/person/place/text/style at the **yellow dot**. The dot is the annotation; do not treat it like a bounding box.
3. Compare that dotted entity to the reference photo on the right.
4. Choose a verdict based on whether the relevant identifying features match.
5. Write a short reason naming the feature(s) you used.

Entity-specific criteria

- **Person:** identity is face, hair at the time, visible marks/tattoos, and body/pose cues when face is limited. Outfit alone is not identity.
- **Clothing:** compare the actual garment: cut, color, straps, sleeves, neckline, logo placement, print, fabric, seams, buttons, zippers, length. Similar outfit category is not enough.
- **Product:** compare brand marks, shape, model, colorway, packaging, text, and distinctive details. A different colorway/package is usually different.

- **Location / Landmark:** compare stable features such as architecture, signage, coastline/mountains, storefront layout, monuments. Weather/crowds/lighting can change.
- **Animal:** compare individual markings, coat pattern, build, collar, age, scars. Same breed/species is not enough.
- **Information:** the content itself (text/logo/sign/label) should match. Different font or layout may still be same information if the text/content matches.
- **Style:** broader than identity. Judge whether the reference and target express the same visual style/aesthetic.

Picking confidence

- Use **definitely** when a clear identifying feature matches or conflicts.
- Use **likely** when the answer is probable but the view is partial, low-quality, occluded, or at an unusual angle.
- Use **Skip** for a true coin flip. Do not force a likely answer when there is no signal.

Skip vs flag as bad data

Use **Skip** when the item is valid but you personally cannot decide.

Use **Flag as bad data** when the item itself is broken and should not be verified by anyone, for example:

- Target or reference image does not load.
- Yellow dot is on the wrong entity or on empty/background.
- The entity type/label is clearly wrong for the dotted entity.
- Reference image is unrelated or broken.
- Target and reference are literally the same image/self-comparison.

Do not flag just because the answer is hard.

Reasons

Your reason should name the evidence.

Good: *Same black halter dress shape and neckline.*

Good: *Different straps and different hem length, so likely different garments.*

Bad: *looks same / idk / different.*

Good vs bad: compare the actual garment, not just the category

GOOD EXAMPLE

Input:

Entity type is clothing. The yellow dot marks Clothing 1 — the grey/gold patterned dress. Compare that garment to the reference.

Target: the dot marks Clothing 1 (the grey-and-gold patterned dress).

Reference for Clothing 1: the same patterned dress on a plain background.

Output:

Verdict: Definitely same. Reason: Same grey/gold abstract print, same panelled bodice, same puff sleeves and midi length as the reference.

Good: names concrete garment features (print, panelling, sleeves, length) that match, so Definitely same is justified.

BAD EXAMPLE

Input:

Entity type is clothing. The dot marks Clothing 2 — the black dress on the seated woman — but the reference is a white lace cover-up.

Target: the dot marks Clothing 2 (the black dress on the seated woman at left).

A different reference: a white lace cover-up — different colour, fabric, sleeves and cut.

Output:

Verdict: Definitely same. Reason: Both are dresses.

Bad: the dotted garment is a black sleeveless dress; the reference is a white long-sleeve lace cover-up. Different colour, fabric and cut — the correct call is Definitely different. 'Both are dresses' is a category match, not an identity match.
