

i2i-pixel-aligned-filter

Did the edit make all (and only) the instructed change, and stay aligned?

Each item has an input image, a target image, and an instruction.

Answer three separate questions:

- (1) does the target make all of the instructed change and only that change (instructions aligned),
- (2) are the areas that should stay the same still perfectly aligned with the input (image aligned), and
- (3) are both images free of AI slop (no AI slop).

How to Review

Steps

1. Read the instruction.
2. Watch the large panel on the left — it automatically flips between the input and target so you can spot what moves.
3. Use the labeled **Original** (input) and **Edited** (target) stills on the right to confirm which is which.
4. Answer **all three** questions with Yes or No.

You do not need to explain your answers.

What to watch for

Look at the background, face, body, clothes, hands, objects, shadows, and the edges of the image.

For Question 1, watch whether anything *other than the instructed change* was added, removed, or altered.

For Question 2, watch whether the kept areas stay in the same position and size.

For Question 3, watch **both** images for AI slop — melted or extra fingers, warped faces, gibberish text, distorted shapes, plastic or smeared textures, or broken geometry.

Question 1 — All and only the instructed change

Does the target make all of the instructed change — and only that change?

Choose **Yes** only if BOTH are true:

- **All of it** — every change the instruction asks for is fully done.
- **Only it** — nothing the instruction did not ask for is added, removed, or altered.

Example: if the instruction says "replace the apple with a dog," the apple must become a dog (all of it) and nothing else — the background, people, colors, other objects — should change (only it).

Choose **No** if:

- Part of the instructed change is missing or wrong.
- Something the instruction did not mention was added, removed, or changed.
- The result looks broken, unnatural, blurry, smeared, unfinished, or obviously AI-generated.

This question is about *what* changed. Whether the kept areas stay lined up in the same position is Question 2.

Question 2 — Pixel-aligned

Are the unchanged areas perfectly aligned with the input?

This question is about *position*, not content. Even when the right things were edited, the parts that should stay the same must sit in the exact same place and size as the input.

Choose **Yes** if the kept areas line up perfectly with the input.

Choose **No** if the image (or part of it) shifts, zooms, crops, or resizes so the kept areas no longer line up — for example the whole picture is nudged a few pixels, slightly zoomed, or cropped tighter than the input.

If you are unsure, choose **No**.

Question 3 — No AI slop

Are both images free of AI slop?

This question is about whether the images look like real, clean photos rather than obviously AI-generated junk. Judge **both** the original (input) and the edited (target) image — a sample is only good if **both** are free of slop.

Choose **No** if either image shows AI slop, such as:

- Melted, fused, duplicated, or missing parts — extra fingers, a merged limb, a half-rendered object.
- Warped or distorted faces, hands, fingers, teeth, eyes, or text.
- Gibberish or garbled text, broken logos, or nonsensical repeating patterns.
- Plastic, waxy, or over-smoothed skin and surfaces; smeared or mushy detail.
- Broken geometry, impossible structures, blur, banding, or heavy noise.

Choose **Yes** only if both images look natural and clean.

This is separate from Questions 1 and 2: an edit can follow the instruction and stay aligned but still be **No** here if it looks like AI slop. If you are unsure, choose **No**.

Good vs Bad Examples

Only the instructed change vs. an extra change

Good Example

Input:

Instruction: "Replace the apple with a dog."

Output:

Target: the apple is now a dog, and nothing else is different.

Q1 →  YES

Q2 →  YES

All and only the instructed change, and nothing moved.

Bad Example

Input:

Instruction: "Replace the apple with a dog."

Output:

Target: the apple is now a dog, but the wall behind it also changed color.

Q1 →  NO

Q2 →  YES

The wall color also changed (not requested), so Q1 is No. Nothing shifted, so Q2 is Yes.

Aligned vs. shifted

Good Example

Input:

Instruction: "Make the man appear slightly older."

Output:

Target: the man looks naturally older; everything else is in the same position and size.

Q1 →  YES

Q2 →  YES

Only the requested age change, and everything else stays perfectly aligned.

Bad Example

Input:

Instruction: "Make the man appear slightly older."

Output:

Target: the man looks older, but the whole picture is shifted/zoomed so the background no longer lines up.

Q1 →  YES

Q2 →  NO

The age change is correct, so Q1 is Yes. But the whole image shifted/zoomed, so Q2 is No.

Fully done vs. not done

Good Example

Input:

Instruction: "Turn the car red."

Output:

Target: the car is now red.

Q1 →  YES

Q2 →  YES

The instructed change is fully done and nothing else changed.

Bad Example

Input:

Instruction: "Turn the car red."

Output:

Target: the car is still its original color.

Q1 →  NO

Q2 →  YES

The car never changed, so Q1 is No. Nothing else moved, so Q2 is Yes.

Clean vs. AI slop

Good Example

Input:

Instruction: "Add sunglasses to the person."

Output:

Target: sunglasses added; both images look real and clean.

Q1 →  YES

Q2 →  YES

Q3 →  YES

The edit is correct, aligned, and both images look real.

Bad Example

Input:

Instruction: "Add sunglasses to the person."

Output:

Target: sunglasses added, but the hand is now melted with six fingers and the shirt text is gibberish.

Q1 →  YES

Q2 →  YES

Q3 →  NO

The instructed change is right and aligned, but the melted hand and gibberish text are AI slop, so Q3 is No.
